3 CREATE AI AGENTS
Create AI agents. Automate quality. Drive impact.

DATA QUALITY

BAD

Christopher Bergh
CEO, Head Chef
DataKitchen

Welcome!

Slides, recording, and transcription will be shared this week.

Put your questions in the chat window; we will answer questions at the end of the session.

We have targeted 45 minutes for our presentation, with questions at the end.

Agenda

- 1. What is MCP and why does it matter?**
2. Intro To Testgen MCP Server
3. Testgen UI vs. MCP
4. Testgen MCP Server As An AI Dialog-Based UI
5. Testgen MCP As The Foundation For AI Agents
6. Conclusion

MCP is USB-C for AI

One standardized connector instead of a custom integration for every model and tool

- MCP stands for **Model Context Protocol**
 - Open source standard for connecting AI applications to external systems
- Data sources, tools, and workflows, all through one protocol
- Before MCP: $N \text{ models} \times M \text{ tools} = N \times M$ custom integrations
- After MCP: build once, connect everywhere

The three pieces of MCP

The Host is the app you use. It talks to a Server through a Client that lives inside it.

- Five capabilities: **Resources, Prompts, Tools, Sampling, Roots**
 - In practice, Tools do the work: query a database, run a job, send a message

Why the MCP ecosystem won

One protocol, and work done once benefits everyone

- Everyone building with LLMs hits the same wall: getting a model to use tools reliably
- Every major data quality and observability vendor shipped an MCP server within six months
 - No Open Source – enterprise pricing.
- The agentic story is settled. What still differs is where the server runs.
 - TestGen's MCP server runs behind your firewall, Apache 2.0, on the laptop you use for dbt
 - Your warehouse credentials stay on your network.

Agenda

1. What is MCP and why does it matter?
- 2. Intro To Testgen MCP Server**
3. Testgen UI vs. MCP
4. Testgen MCP Server As An AI Dialog-Based UI
5. Testgen MCP As The Foundation For Ai Agents
6. Conclusion

DataKitchen DataOps Data Quality TestGen:

Open Source, Full Featured, Data Quality Tool.

IT DOES SIX TASKS:

1.  Data Profiling
2.  Dataset Screening And Hygiene Review
3.  AI Generation of Data Quality Validation Tests, Custom Tests
4.  Data Testing
5.  Anomaly Monitoring
6.  Data Quality Scoring

KEY FEATURES

- ✓ In Database Execution
- ✓ Full Featured (UI, AI, Rules) One User
- ✓ Enterprise Version starts at \$100 per user per month

TestGen MCP: the complete loop

TestGen 5.70.2 completes the server. 96 tools covering the whole data quality loop.

- Eight stages: **discover, profile, hygiene, test, run, monitor, score, operate**
- Callable from Claude, Claude Code, Cursor, Copilot, or the agent you're building
- You no longer need the TestGen UI open to run TestGen. You need a chat window.
- Open source under Apache 2.0, same as TestGen itself

TestGen MCP: Secure

- Every tool that writes to your TestGen instance carries an orange dot on the cheat sheet. Everything else is read-only.
- The server authenticates as you and runs with your TestGen role
- An analyst's assistant can read scores. It cannot delete scorecards.
- Dispositions, test notes, and run history land in TestGen the same way as UI actions.
- The agent leaves footprints your governance team can follow.
- <https://datakitchen.io/blog/testgen-mcp-cheat-sheet/>

OPEN SOURCE · APACHE 2.0

DataOps TestGen MCP

Why you should care: your AI assistant is smart but blind to your data quality. This fixes that. Ask in plain English; TestGen profiles the tables, writes the tests, runs them, and hands back the failing rows. **96 tools** plus MCP resources and prompts, in Claude, Claude Code, Cursor, Copilot, or any MCP client. Free, like TestGen itself.

CONNECT

Endpoint `https://<host>/mcp`
OAuth 2.1 paste the URL, sign in via browser
Token header `Bearer <PAT>` (Enterprise)
Local `http://localhost:<port>/mcp` (plain http)
Verify 'list the projects I have access to'

1 Discover your estate

Map projects, connections, table groups, and tables. Sample real rows. Find columns anywhere. Rebuild DDL from profiles.

`get_data_inventory` `list_projects` `get_project`
`create_project` `update_project` `list_connections`
`get_connection` `create_connection` `update_connection`
`test_connection` `list_table_groups` `get_table_group`
`create_table_group` `update_table_group` `preview_table_group`
`list_tables` `get_table` `get_table_sample` `search_columns`
`generate_create_table_script` `update_catalog_metadata`

3 Triage hygiene issues

Review what profiling flagged: bad blanks, type drift, PII, stale dates. Confirm, dismiss, or mute each finding.

`list_hygiene_issues` `search_hygiene_issues` `get_hygiene_issue`
`update_hygiene_issue`

5 Run tests, investigate failures

Execute suites. Summarize and trend failures. Compare runs for regressions. Pull the exact offending rows from the source database.

`run_tests` `cancel_test_run` `list_test_runs` `get_test_run`
`compare_test_runs` `get_failure_summary` `get_failure_trend`
`list_test_results` `search_test_results`
`list_test_result_history` `update_test_result`
`bulk_update_test_results` `get_source_data`
`get_source_data_query`

7 Score quality

Total, CDE, Profiling, and Testing scores. Slice by quality dimension, business domain, or data product. Manage scorecards.

`get_quality_scores` `list_scorecards` `get_scorecard`
`create_scorecard` `update_scorecard` `delete_scorecard`

2 Profile your data

Run profiling, compare runs, trend metrics over time, and catch schema drift. Drill to per-column stats, frequent values, and patterns.

`run_profiling` `cancel_profiling_run` `list_profiling_runs`
`get_profiling_run` `list_profiling_summaries`
`compare_profiling_runs` `get_profiling_trends`
`get_schema_history` `list_column_profiles`
`get_column_profile_detail` `get_column_frequent_values`
`get_column_patterns`

4 Generate & manage tests

Tests write themselves from the profile. Full CRUD, bulk toggles, portable export between suites, dry-run validation for custom SQL, and suites that push results into DataOps Observability.

`generate_tests` `list_tests` `get_test` `create_test`
`update_test` `bulk_update_tests` `export_tests`
`import_tests` `validate_custom_test` `list_test_types`
`get_test_type` `list_test_suites` `get_test_suite`
`create_test_suite` `update_test_suite` `create_test_note`
`list_test_notes` `update_test_note` `delete_test_note`

6 Monitor tables

Turn on anomaly monitors per table group. Watch freshness, volume, and schema changes without writing a single test.

`enable_monitors` `disable_monitors` `get_monitor_settings`
`update_monitor_settings` `get_monitor_summary` `list_monitors`
`list_monitored_tables` `list_monitor_events`
`list_monitor_schema_changes`

8 Operate on a schedule

Recurring profiling and test runs. Email alerts on failures, new hygiene issues, or a score dropping through a threshold.

`list_schedules` `get_schedule` `create_profiling_schedule`
`create_test_run_schedule` `update_schedule` `delete_schedule`
`list_notifications` `get_notification` `create_notification`
`update_notification` `delete_notification`

PROMPTS TO TRY

> What data do I have and how healthy is it?
> Generate tests, run them, summarize failures by table
> Compare this week's test run to last week's

> Profile the sales table group and show new issues
> Show me the source rows behind that failure
> Email me when the total score drops below 75

• writes to your TestGen instance — all else read-only • source-data & validation tools run read-only SQL on your database • tools use your TestGen role permissions docs.datakitchen.io/testgen/mcp • Copyright 2026 by DataKitchen, Inc.

Five-minute setup

No SKU, no per-seat agent tax

1. Point your MCP client at `https://<your-testgen-host>/mcp`
2. Sign in with browser OAuth or a personal access token
3. Ask: **"List the projects I have access to in TestGen."**
4. If your projects come back, you're live

Setup guide

docs.datakitchen.io/testgen/mcp/setup covers personal access tokens and hosted platforms like Databricks Genie

Agenda

1. What is MCP and why does it matter?
2. Intro To Testgen MCP Server
- 3. Testgen UI vs. MCP**
4. Testgen MCP Server As An AI Dialog-Based UI
5. Testgen MCP As The Foundation For Ai Agents
6. Conclusion

The TestGen UI isn't going anywhere

MCP is a second front door, not a replacement

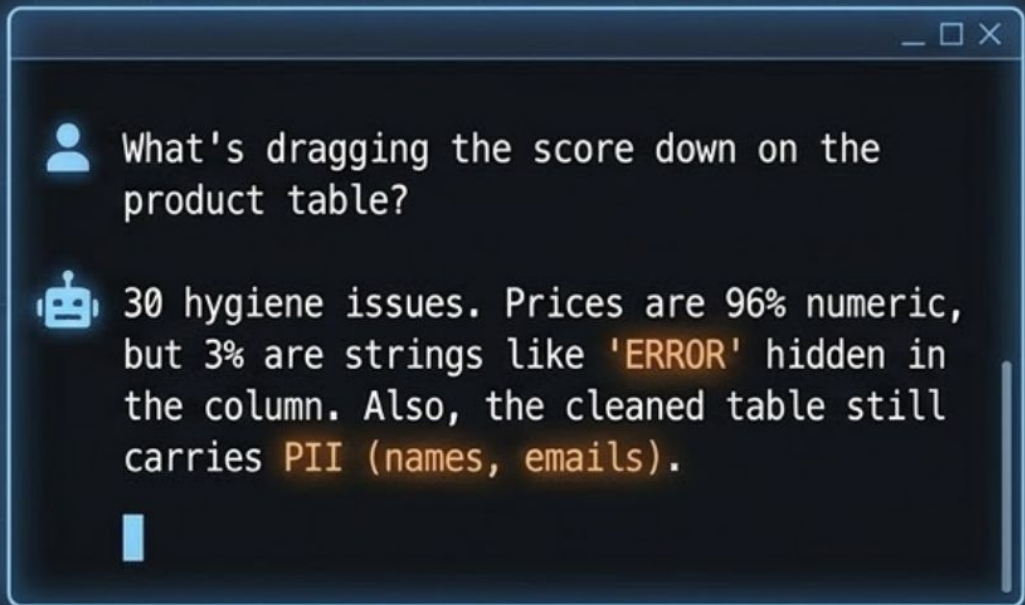

The UI Dashboard Map

The dashboard features a top section with two line charts and three scorecards. The first scorecard shows '32' and '1+'. The second and third scorecards show '120', '135', and '200' respectively. Below these is a table with columns labeled 'Catalog', 'Product ID', 'Product Name', 'Product Type', 'Product Category', and 'Product Subcategory'. The table contains several rows of data. To the right of the dashboard is a sidebar with a list of items.

Use the UI for density. Great for visual exploration, scorecards, and catalog navigation.

The Chat HUD

The chat window contains two messages. The first message is from a user and asks: 'What's dragging the score down on the product table?'. The second message is from a bot and responds: '30 hygiene issues. Prices are 96% numeric, but 3% are strings like **'ERROR'** hidden in the column. Also, the cleaned table still carries **PII (names, emails)**.'

Use Chat for targeted triage. The investigation that used to span five screens now fits in one window.

The TestGen UI isn't going anywhere

MCP is a second front door, not a replacement

Use the UI

- Interactive and easy: Quality Dashboard, Score Explorer, Data Catalog, test results
- Dense and quick once you know it
- If you live in TestGen every day, the UI is still the fastest way to work

Same data, same security model, different surface.

Where the UI stops

- No AI chat interface, on purpose. TestGen has no built-in chatbot.
- MCP fills the gap for three moments:
 - You'd rather ask in English from Slack
 - You hand a teammate a way in without training them
 - You let an agent run on a cron at 3 am

The screenshot shows the 'Monitors' section of the DataKitchen interface. It displays a table with columns for 'TABLE', 'FRESHNESS', 'VOLUME', 'SCHEMA', and 'METRICS'. The table lists several data tables with their corresponding status indicators (green for good, red for issues). A sidebar on the left contains navigation links for Project Dashboard, Data Catalog, Profiling Runs, Data Quality Testing, Monitors, Test Runs, Test Suites, Data Configuration, Table Groups, Connections, Settings, User Access, and Project Settings. The top right corner shows a 'Help' button and a 'Table Group' dropdown.

TABLE	FRESHNESS	VOLUME	SCHEMA	METRICS
d_ebike_customers	✓	1	2	-
d_ebike_products	✓	✓	✓	✓
d_ebike_suppliers	1	✓	✓	-
f_ebike_returns	-	1	1	-
f_ebike_sales	✓	1	✓	✓

Agenda

1. What is MCP and why does it matter?
2. Intro To Testgen MCP Server
3. Testgen UI vs. MCP
- 4. Testgen MCP Server As An AI Dialog-Based UI**
5. Testgen MCP As The Foundation For AI Agents
6. Conclusion

AI dialogue: one window, not five screens

You ask in plain English. The tool answers with the actual data and the actual history.

The questions you actually ask

- Why did this fail? Is it new?
- Show me the rows
- What changed since last Tuesday?
- What test is missing from this table?

What you can do

- **Diagnose** Root Causes
- **Update** source data quality, make changes to data
- **Improve** your test suites by adding new tests
- **Do** almost everything the UI can do

The investigation that used to span five screens fits in one window.

A real conversation: blind to trusted

One question, thirty seconds, a morning of work

- **"What data do I have and how healthy is it?"** Full inventory, a quality score of 78.9 on a table group we'd been ignoring
- **"What's dragging the score?"** 30 hygiene issues nobody had tested for
 - Every column loaded as varchar(65535). Prices 96% numeric, dates 97% dates, and the remaining 3% strings like ERROR and UNKNOWN hiding in numeric columns.
- **"Show me the rows behind that."** The actual offending records from the source database, not a chart about them
- **Look at the product table in our warehouse. Find the latest test failures, investigate root causes, recommend fixes, and graph the failure counts over the last 30 days. Then suggest any new tests we should add and add them to the suite.**
- **"Recommend tests and run them."** Twelve failures. Dismiss one, confirm the rest, every disposition lands with an audit trail.

Six slash commands for triage

Triage is where data quality programs die. The assistant doesn't get tired of failure 40 at 8 am.

- `/health_check` What's on fire, in a summary, not a dashboard
- `/investigate_failures` Failures grouped by test type and column, with the actual rows
- `/hygiene_triage` Confirm, dismiss, or mute the 32 hygiene categories
- `/compare_runs` What changed since yesterday
- `/table_health` Is this specific table healthy
- `/profiling_overview` Onboard a new dataset

Dialogue finds the tests you're missing

Profile + existing tests + 49 possible test types = coverage gaps fall out

- The assistant holds three things in context at once:
 - What your data looks like (the profile)
 - What tests already exist (the suite)
 - What tests are possible (the catalog of 49 test types)
- Example: email column is 99.7% valid format in the profile, but no Email Format test exists in the suite. Recommend one, with the column, the threshold, and the reason.
- You confirm the ones you want. The assistant adds them to the suite.

Column	Profile says	Recommend
email	99.7% valid format, no test	Email Format
customer_id	100% unique, not null, no test	Uniqueness
country_code	47 values, should be 2-letter ISO	List of Values
signup_date	tight 3-year range, no test	Date Range

Demo

Update Poor Data Quality

› look at all the hygiene issues and data test failures and list the first three I should investigate. ignore the priority (Likely, definite) and type (error warning) and make your suggestion.

- Let me pull both hygiene issues and test failures in parallel.

Called testgen 3 times

- Here are the three I'd tackle first, based on severity, scale, and downstream impact:

1. Duplicate customer_id in d_ebike_customers (25 duplicates)

This is a primary key integrity failure. Every join, every sales analysis, every customer metric built on this table is potentially double-counting or mis-attributing records. It poisons everything downstream. Fix the root cause here before trusting any customer-level reporting.

2. credit_card in d_ebike_customers -- 169 duplicates AND 169 pattern mismatches

Two separate tests failing on the same column at the same scale (169 records) is a strong signal of something systemic -- corrupted load, field misuse, or a schema change that left the column storing the wrong thing. The overlap between both failures at identical counts makes this look like a wholesale column problem, not scattered bad rows.

3. supply_reliability in d_ebike_suppliers is completely empty (28 of 28 records)

Every row in the supplier table has an empty string in this column, and manufacturing_certifications is also 100% null. A table named after suppliers, where the reliability and certification fields carry no data at all, means any supplier risk analysis is running blind. The question is whether this data was never loaded or was lost -- either way, it is a gap that silently undermines operational decisions.

The PII flags and the sales amount minimums are real but lower urgency -- the three above affect data integrity at scale or create structural blind spots.

› what is the sql to fix the customer_id issue in d_ebike_customers? It is a postgres DB.

- Let me look at the actual duplicate data before writing a fix.

Called testgen 2 times

- Now I have everything I need. Here is the SQL, in the order you should run it.

Step 1 -- See the duplicates before touching anything:

```
SELECT customer_id, COUNT(*) AS occurrences
FROM demo.d_ebike_customers
GROUP BY customer_id
HAVING COUNT(*) > 1
ORDER BY occurrences DESC;
```

Step 2 -- Preview which rows will be deleted (keep the most recently contacted record per customer_id):

```
WITH ranked AS (
    SELECT ctid,
           customer_id,
           last_contact,
           ROW_NUMBER() OVER (
               PARTITION BY customer_id
               ORDER BY last_contact DESC, ctid ASC
           ) AS rn
    FROM demo.d_ebike_customers
)
SELECT * FROM ranked WHERE rn > 1;
```

Step 3 -- Delete the duplicates (wrap in a transaction so you can roll back):

```
BEGIN;

WITH ranked AS (
    SELECT ctid,
           ROW_NUMBER() OVER (
               PARTITION BY customer_id
               ORDER BY last_contact DESC, ctid ASC
           ) AS rn
    FROM demo.d_ebike_customers
)
DELETE FROM demo.d_ebike_customers
WHERE ctid IN (SELECT ctid FROM ranked WHERE rn > 1);

-- Verify: should return 0
SELECT COUNT(*) FROM demo.d_ebike_customers
GROUP BY customer_id
HAVING COUNT(*) > 1;

-- If clean, commit. Otherwise ROLLBACK.
COMMIT;
```

Step 4 -- Enforce uniqueness going forward:

```
ALTER TABLE demo.d_ebike_customers
    ADD CONSTRAINT d_ebike_customers_customer_id_pk PRIMARY KEY (customer_id);
```

A few caveats before you run this:

- The tiebreaker here is `last_contact DESC` -- keeping the most recently active record. If your business rule is different (e.g., keep earliest `first_contact`), swap the `ORDER BY`.
- Check whether `f_ebike_sales` has a foreign key on `customer_id`. If duplicate rows in the customer table are referenced by sales rows, you may need to repoint those sales records before deleting.
- Run Step 3 in a transaction and verify the count check returns 0 before committing.

```
> what is the SQL to fix the hygiene issue Similar Values Match When Standardized on Table  
d_ebike_products  
Column  
product_type
```

- Let me pull the actual values in that column before writing anything.

Called testgen 2 times

- The picture is clear. Eight distinct values collapse to three when standardized. "Bicycle" and "E-scooter" are clean. The problem is five variants of "E-bike" that should all be the same value.

Raw value	Count
E-bike	9
e-bike	1
EBike	1
Ebike	1
EBIKE	1
E--Bike	1

Step 1 -- Preview what will change:

```
SELECT product_type, COUNT(*) AS records
FROM demo.d_ebike_products
WHERE product_type IN ('e-bike', 'EBike', 'Ebike', 'EBIKE', 'E--Bike')
GROUP BY product_type
ORDER BY product_type;
```

Step 2 -- Fix it (normalizing all variants to "E-bike", the dominant form):

```
BEGIN;
```

```
UPDATE demo.d_ebike_products
SET product_type = 'E-bike'
WHERE product_type IN ('e-bike', 'EBike', 'Ebike', 'EBIKE', 'E--Bike');
```

```
-- Verify: should show exactly 3 distinct values
```

```
SELECT product_type, COUNT(*) AS records
FROM demo.d_ebike_products
GROUP BY product_type
ORDER BY product_type;
```

```
COMMIT;
```

After the fix you should see:

product_type	records
Bicycle	15
E-bike	14
E-scooter	12

One thing to confirm before running: make sure "E-bike" is the canonical value your business uses. If a style guide or downstream system expects a different casing (e.g., "eBike" or "E-Bike"), substitute that into the SET clause instead.

What is the SQL test that TestGen uses to find that values match when standardized on table d_ebike_p...

- Let me explore the data and existing test coverage to find a meaningful gap.

Called testgen 3 times

- Now I have a full picture. 214 tests across four tables, but one gap stands out: there is no cross-table business rule test anywhere in the suite. Every test validates a single column in isolation.

The most valuable custom test to add:

Discount amount exceeds the product's maximum allowed discount

f_ebike_sales has a discount_amount column, and d_ebike_products has a max_discount column that exists precisely to cap it. No standard TestGen test can join across tables to enforce that rule. Given the existing failures on adjusted_total_amount and the Aggregate Balance failure on SUM(total_amount), an over-applied discount is a plausible cause worth catching explicitly.

```
SELECT
  s.sale_id,
  s.product_id,
  p.product_name,
  s.discount_amount,
  p.max_discount,
  s.total_amount,
  s.adjusted_total_amount
FROM demo.f_ebike_sales s
JOIN demo.d_ebike_products p ON s.product_id = p.product_id
WHERE s.discount_amount > p.max_discount
```

This is a Custom SQL Test -- it returns one row per violation. Zero rows means the test passes.

Why this one over the alternatives:

- f_ebike_returns has no tests at all, but I'd need to see its schema before writing meaningful rules.
- A total_amount = sale_price * quantity_sold - discount_amount math check is also good, but the existing Aggregate Balance test already approximates that.
- The discount cap is the only test that would catch a real pipeline error -- a discount rate applied at load time that exceeds what the product allows -- and it is impossible to express with any standard test type.

Want me to add it to the suite?

Demo

Recommend and Add New Tests

```

  ✓ 🗂️ chatgptdata
    ✓ 📁 tables 2
      > 📊 dirty_cafe_sales
      > 📊 sample_data_quality_errors

```

Create a Database Connection named: chatgptdata-connection ...

Then

Create a table group named: chatgptdata-tablegroup

With schema: chatgptdata

From the Database Connection named chatgptdata-connection

Then

Profile the data in the chatgptdata-tablegroup

Then

Summarize the results

Then

Create a test suite: chatgptdata-testsuite

From the table group named: chatgptdata-tablegroup

Then

Run the tests in chatgptdata-testsuite

Then

Summarize the results

Then

Review the test results and the hygiene issue; give me a list of recommended tests to add to the test suite

Then

Create the test and add a note on the test itself you added saying 'created from claude'

Recommended tests to add

These fill the gaps between what the hygiene issues found and what the auto-generated suite currently checks. Grouped by table.

dirty_cafe_sales

1. Numeric format check on `Price Per Unit`, `Total Spent`, and `quantity`. All three are stored as text but roughly 96 percent numeric. Add a pattern or regex test so the non-numeric junk (the "ERROR" and "UNKNOWN" strings) gets caught and counted.
2. Date format check on `Transaction Date`. Stored as text, 96.9 percent valid dates, at least three competing patterns. A format test flags the remaining bad strings.
3. Dummy value check on `Payment Method`, `location`, `item`, `quantity`, `Price Per Unit`, `Total Spent`, and `Transaction Date`. A "value should not be in list" test against your known placeholder tokens closes the completeness blind spot described above.
4. Positive value range on `quantity` and `Price Per Unit`. Both should be greater than zero once cast.
5. Cross column reconciliation: `Total Spent` should equal `quantity` times `Price Per Unit`. A custom test here catches arithmetic and data entry errors that no single column test will find.
6. Value in set on `Payment Method` and `location`. Constrain each to its real list of allowed categories.

sample_data_quality_errors

7. Range check on `age`. Constrain to a plausible band such as 0 to 120. Only unique and required are checked today.
8. Non-negative range on `Annual Income`.
9. Past date check on `Date of Birth`. Reject future dates and implausibly old ones.
10. Phone format check on `Phone Number`. A pattern test standardizes what is currently only length and missing checks.
11. Value in set on `gender`. Constrain to your allowed codes to catch the 202 non-standard blanks profiling found.

Both tables, operational

12. Row count and freshness tests once these become live feeds rather than static samples. Volume drift and stale loads are the failures that column tests never surface.

☐ Multi-Select

Agenda

1. What is MCP and why does it matter?
2. Intro To Testgen MCP Server
3. Testgen UI vs. MCP
4. Testgen MCP Server As An AI Dialog-Based UI
- 5. Testgen MCP As The Foundation For AI Agents**
6. Conclusion

From chat to delegation

An agent is a program that acts on your behalf

The paradigm shift: The tools you use in a chat today are the exact same tools your autonomous agent uses tomorrow.

The MCP server is the shared heart of both. You can scale from simple plain-English Q&A to full automation without ever changing your security model or tooling infrastructure. The question simply shifts: What guardrails do you need to let it act?

Agents that fix data quality, with control

A design pattern: the fix is easy, the control is the hard part

- You don't want an agent rewriting your source tables on its own at 2 am
- You want it to find the problem, propose the exact SQL, and wait for a human to say "yes, fix that one"
- Two small Python programs: one finds problems and proposes fixes, one applies only what you approved

Why "just automate it" is a trap

On source data, a wrong fix is expensive. You don't notice until the dashboard is off and the bad write already ran.

The problem is the judgment, not the SQL

You save time by handing off the boring work and keeping the one decision that matters

The new paradigm: the human-gated agent

The agent proposes. You approve. The agent applies.

The discovery engine is Claude calling the TestGen MCP server. No glue code, no scraping a UI.

Coffee-break data quality

The 2 am UPDATE becomes a dropdown: Please Fix, Needs Reply, or Do Not Fix

The Old Way

Manually writing the same UPDATE statements every time the source load breaks.

The New Way

Your call, in the Jira UI, over coffee. The agent automatically merges your comments into a final SQL plan, dropping anything you vetoed.

Control lives in a 10-second dropdown. You read the plain-English findings, leave a comment if necessary, and change the status. The agent automatically merges your comments into a final SQL plan, dropping anything you vetoed.

The data quality resolution

Speed of automation, and you keep the veto

	Speed & Scalability	Safety & Accuracy	Human Effort
Manual Coding	Slow / Low 	High 	Exhausting 
Unsupervised AI	Lightning Fast 	Unpredictable / High Risk 	Zero 
Human-Gated Agent	Fast 	100% Controlled 	Minimal / 10 Seconds 

Example

The human-gated agent loop

- The agent files a Jira ticket with proposed SQL
- Flip the disposition flag to Please Fix
- The fix applies on a copy table, and the ticket closes itself

Demo – Find the list of data issues

Demo – fix the list of data issues

Automation on your terms

Your sources will keep sending bad data. Now you fix it once, on your terms, and the agent handles the rest.

- Benefits
 - You get the speed of automation, and you keep the veto
 - Bad data stops being a recurring chore and becomes a ticket you approve over coffee
 - The MCP server gives the agent eyes, hands, and memory. What you build on top is the policy.

If you want to recreate this in your own environment, we wrote a PRD you can load straight into Claude Code.

- It names the two programs, the contract between them, the safety gates, and the config — enough for Claude to rebuild the pattern against your stack.
- [Download the PRD](#) and load it into Claude Code to build the human-gated data quality fix agent in your own environment.
- blog: <https://datakitchen.io/blog/agents-fix-data-quality-automatically-with-control/>

Agenda

1. What is MCP and why does it matter?
2. Intro To Testgen MCP Server
3. Testgen UI vs. MCP
4. Testgen MCP Server As An AI Dialog-Based UI
5. Testgen MCP As The Foundation For AI Agents
- 6. Conclusion**

Conclusion

1. **What fast, direct answers?**
2. **Want to:**
 - a. Diagnose Root Causes?
 - b. Update source data quality, make changes to data?
 - c. Improve your test suites by adding new tests?
3. **Want to Automatically, repeatedly:**
 - a. Fix data,
 - b. add tests,
 - c. automate data quality?

Use the TestGen UI
Use TestGen MCP in an LLM

Create An Agent (with control)

Using TestGen's New MCP

AMAZE, AMAZE, AMAZE

Build it tonight

Install, connect, and ask what's wrong with your data. It will tell you.
That's the uncomfortable part. Twenty minutes, no sales call.

```
python3 dk-installer.py tg install
```

Open Source

Available under Apache 2.0 at
